## The adaptive Information System tool and platform

### Made to be adaptive to meet change

In an ever changing world where the life cycles of products, support systems, sales and basically all cycles of the value chain is becoming shorter, we need frameworks and tools to proactively and promptly adapt accordingly. One driving factor behind "spinning the wheel of change" is information. The continuous evolving technology provides us with an ever improving vehicle for access and sharing of information independent of location. To maintain a sustainable competitive advantage in this environment, organizations' business processes must be adaptive to deliver operational excellence.

Today's fixed applications are ranging from cumbersome to prohibitively costly to maintain and evolve when need to adapt to changes surface. Adapting the organizations way of operation to fit the IT application at hand is all too often the means to cope when it should be the other way around. This tends to become a costly way to align to evolving business conditions and a comparatively higher cost level in the operation quickly erodes competitiveness.

IS Tools was designed to address these issues by being flexible and dynamic and thus easily configurable to adapt and align to your business processes – not the other way around. IS Tools keeps you in a state of readiness for change. In short – with up-to-date operational business process support using the adaptive IS Tools solution you can focus on realizing prompt delivery on targets at a low cost of operation.

### Cost effective value offering

The cornerstones of the IS Tools value offering is cost effectiveness and based on primarily:

- **Configuration:** Business process applications are configured in the IS Tools platform. The time saved is significant and reduces "the time-to-productive system" immensely.
- **Flexible and dynamic:** Configured applications can be tested, amended and further configured while in operation with users on-line.
- **Scalability:** Several separated business applications can be configured and operated on the same IS Tools platform giving substantial cost savings in the IT operation and structure. Deployment of your choice in either a centralized or a distributed IT environment.

### User friendly

IS Tools provides a user configurable web browser database application. Programming knowledge is not necessary. Content and appearance of the configured application is decided by the user and it can be changed at any time without losing traceability and stored data. These unique features make it possible to consolidate a variety of several fixed IT applications in to one IS solution.
